**Recruiting Team**  
Google India

**Subject:** Application for Software Engineering Internship 2026

Dear Google Team,

I'm Aradhye, currently a CS student at VIT, and I like building things that work (and occasionally, things that break in interesting ways before they work). I'm applying for the 2026 Software Engineering Internship because building scalable systems that actually get used is my kind of fun, and Google feels like the place to push that to the next level.

I've led projects like *Echoid* (offline voice cloning), *Fortify* (smart contract IDE with AI checks), and *blurt*. (a chat-based news platform under *nahneed*.) while diving into **Python, JavaScript/TypeScript, C++, Node.js**, and tinkering with **AWS and Docker** on the side. During my internship at **algoalap**, I built an AI pipeline to automate video processing and learned a lot about debugging pipelines when they don't cooperate at 3am.

Outside code, I'm the Motion Graphics Head at ISTE, leading a team of 10+ while mixing design with tech, managing large events, and learning how to keep projects fun without dropping the ball.

I'm excited about the idea of contributing to Google projects that scale to millions, learning from people who care about clean design, and maybe even adding a bit of my "let's just build it and see" energy to the team.

Thanks for reading, and I'd love to chat.

Best,  
**Aradhye Swarup**
